

**Diverse tools and methods enable us to collect relevant information about coverage and analyse and validate findings**

**Triangulation ensures that the investigation is an intelligent and purposeful process**

**How and which tools are used depend on the particular context and the skills of the investigating team**

**Tools can and should be used to strengthen routine programme monitoring activities**

# SQUEAC Stages

**STAGE 2**

## **Stage 2:**

**Confirm the location of areas of high and low coverage and the reasons for coverage failure identified in stage one using small studies, small surveys or small-area surveys.**

**Quantitative and qualitative data from the Stage 1 investigation provide information as to:**

- **Where coverage is likely to be satisfactory / unsatisfactory**
- **Likely barriers**

**Information can be stated as a hypothesis to test  
(confirm / disprove)**

**How do we chose the right sampling approach?**

## **Small Studies**

**Semi-quantitative pieces of work that focus on testing a single hypothesis, generally relating to processes that affect coverage rather than to coverage directly.**

### **Example:**

**OTP-SFP Interface could be tested through an observational study.**

## **Small Surveys**

**Small sample surveys undertaken in population groups.**

### **Example:**

**Differences in coverage between religious groups (e.g. Christian vs. Muslim communities) or livelihood groups (e.g. agriculturalists vs. Pastoralist) can be tested using small surveys.**

## **Small-area Surveys**

**Small sample size surveys used to test hypotheses regarding the spatial distribution of coverage.**

### **Example:**

**Differences in coverage between different parts of a district (e.g. highland vs. lowland) can be tested this way.**

**If Small-Area Surveys are chosen, how do we  
sample?**

## **We purposively select villages/communities based on our hypothesis**

<b>Coverage is <u>High</u></b>	<b>Coverage is <u>Low</u></b>
<ul style="list-style-type: none"><li>• High admissions</li><li>• Proximity to health centre</li><li>• Active case finding by volunteers</li></ul>	<ul style="list-style-type: none"><li>• No/few admissions</li><li>• Patchy provision of OTP sites</li><li>• Distance / villages fall between health centres</li></ul>
Village/Community A	Village/Community X
Village/Community B	Village/Community Z

**If the hypothesis is correct (and you select an appropriate threshold)**

<b>Coverage is <u>High</u> (as per hypothesis)</b>	<b>Coverage is <u>Low</u> (as per hypothesis)</b>
<b>Coverage &gt;Threshold</b>	<b>Coverage &lt;Threshold</b>

Small area surveys in SQUEAC rely on an active & adaptive methodology.

**Active:** because it looks for SAM cases rather than expecting to find them in the sample

**Adaptive:** because it uses information collected during the survey to improve the search for cases

You should look for ALL SAM children, **(those already in the programme and those not in the programme).**

To actively ignore one group or the other is to introduce an unnecessary bias.

Case-finding needs to be **EXHAUSTIVE**

**How does active/adaptive case-finding work in practice?**

## **First Step**

### **Develop a Case Finding Question**

**A description of the children we need to include in the sample – a representation reflecting perceivable characteristics, local understandings of the condition, local terminology and aided by visual representations.**

**This information is collected in Stage 1**

## Second Step

### Identify Key Informants

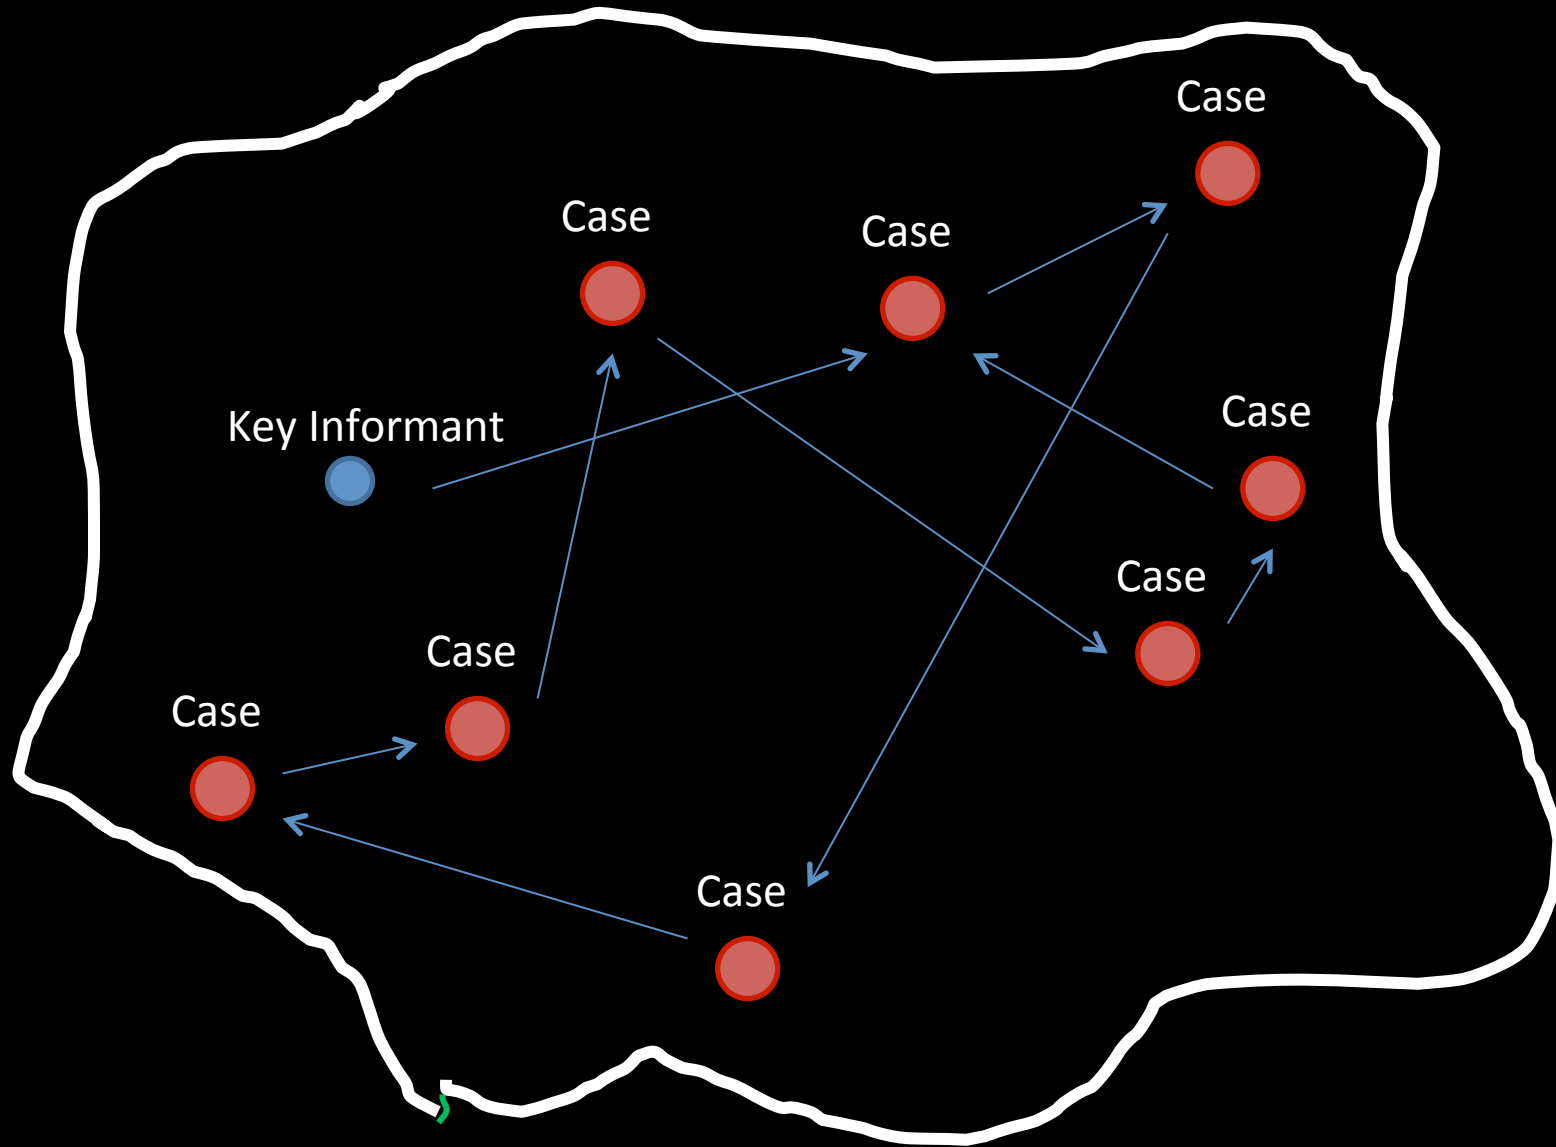

Community members who, because of their role, are more likely to know the location of cases. These should include a combination of community volunteers (**excluding programme case finders**), local leaders, traditional health practitioners (TBAs, etc), mothers of current/recovering cases, children, etc.

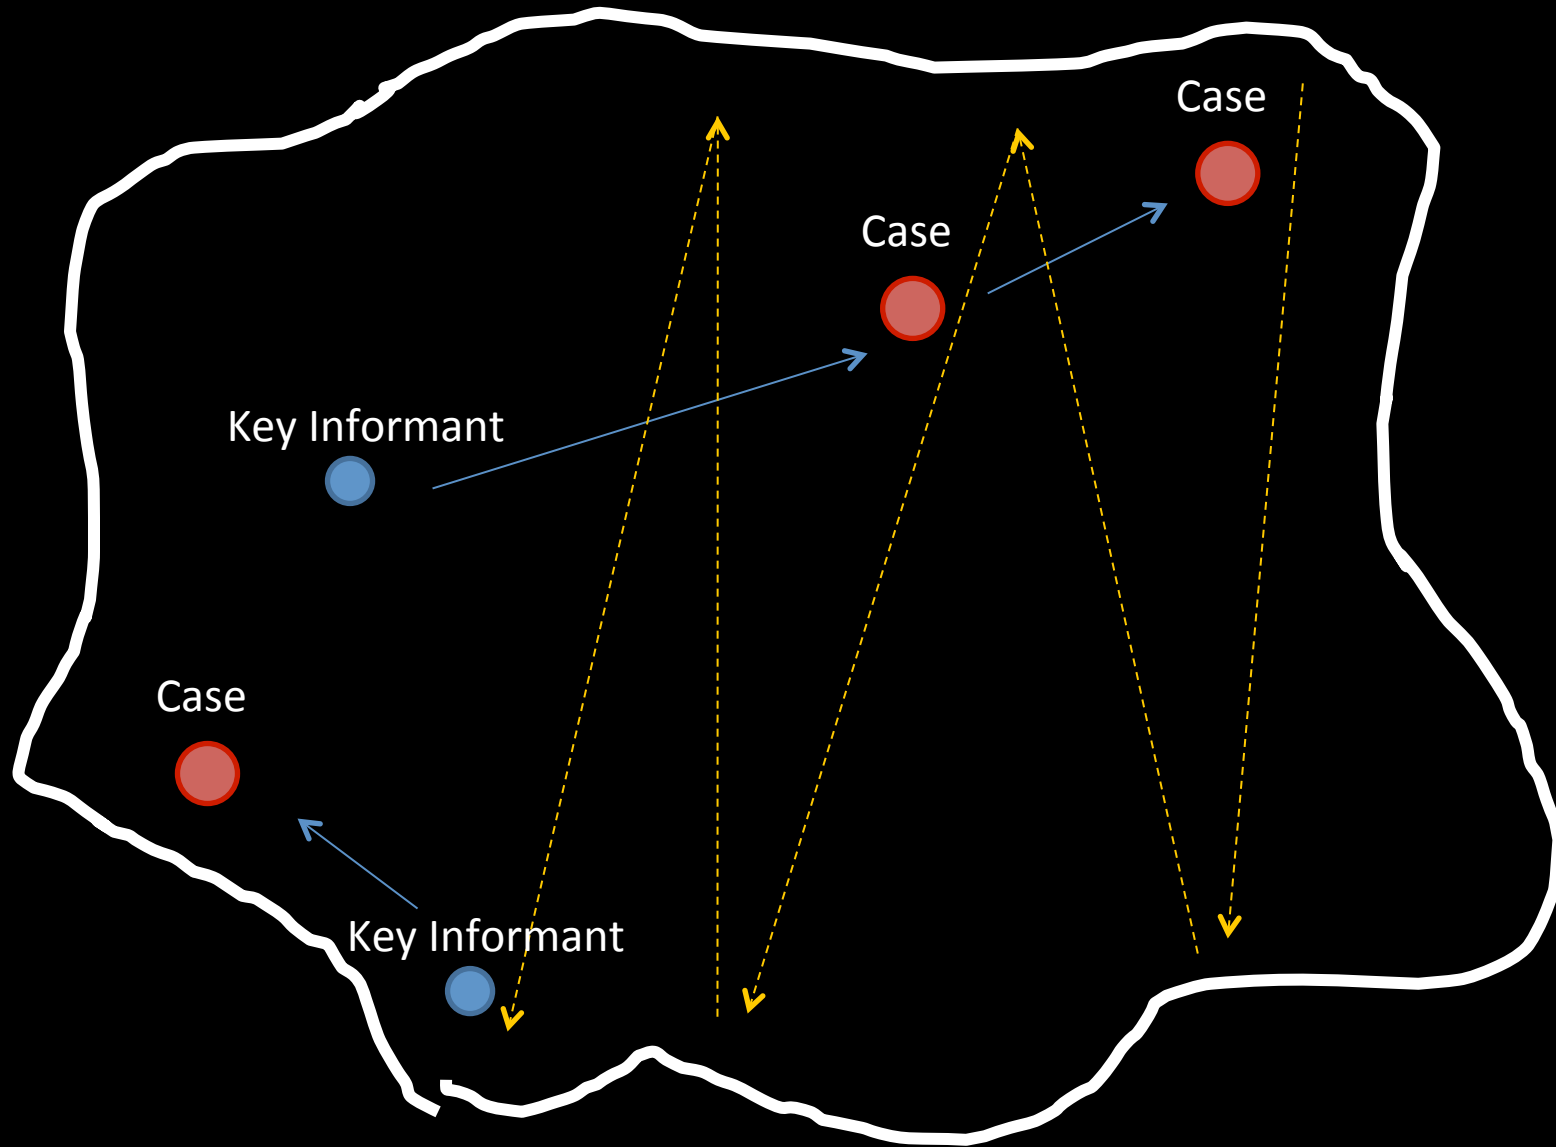

Some key informants can be determined during Stage 1

## **Third Step**

### **Share Case Finding Question with Key Informants**

**Explain what kind of cases are being sought, and ask whether he/she is able to identify such cases.**

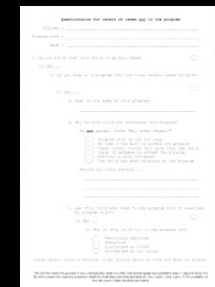

# Fourth Step

## Record Data

Recovering Child IN the programme	Malnourished Child <u>IN</u> the programme	Malnourished Child <u>NOT</u> IN the programme

Apply Questionnaire

QUESTIONNAIRE FOR MONITORING OF CHILDREN IN THE PROGRAM

Child's Name: \_\_\_\_\_

Age: \_\_\_\_\_

Sex: \_\_\_\_\_

Weight: \_\_\_\_\_

Height: \_\_\_\_\_

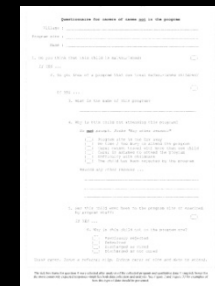

Number of children in the program: \_\_\_\_\_

Number of children who are malnourished: \_\_\_\_\_

Number of children who are NOT malnourished: \_\_\_\_\_

Number of children who are recovering: \_\_\_\_\_

Number of children who are malnourished but NOT in the program: \_\_\_\_\_

QUESTIONNAIRE FOR MONITORING OF CHILDREN IN THE PROGRAM

Child's Name: \_\_\_\_\_

Age: \_\_\_\_\_

Sex: \_\_\_\_\_

Weight: \_\_\_\_\_

Height: \_\_\_\_\_

Number of children in the program: \_\_\_\_\_

Number of children who are malnourished: \_\_\_\_\_

Number of children who are NOT malnourished: \_\_\_\_\_

Number of children who are recovering: \_\_\_\_\_

Number of children who are malnourished but NOT in the program: \_\_\_\_\_

**Results can be classified using simplified LQAS  
(Lot Quality Assurance Sampling)**

**If we use a standard of 50% (SPHERE standard for rural programmes)  
then the following formula can be used:**

$$d = \left[ \frac{n}{2} \right]$$

If we use a standard other than 50%  
then the following formula should be used:

$$d = \left[ n \times \frac{p}{100} \right]$$

**An example...**

If we use a standard of 50%

And we find 7 children that meet our case definition (e.g. SAM)

And of those 2 are enrolled in the programme

$$d = \left\lfloor \frac{n}{2} \right\rfloor = \left\lfloor \frac{7}{2} \right\rfloor = \left\lfloor 3.5 \right\rfloor = 3$$

**If we use a standard of 50%**

**And we find 7 children that meet our case definition (e.g. SAM)**

**And of those 2 are enrolled in the programme**

**Because 2 is not higher than our threshold value ( $d = 3$ ),  
coverage is classified as being <50%**

**If your hypothesis of e.g. low coverage is proven, then you have confirmation that the barriers identified are having an impact (and must be addressed)**

**If your hypothesis is not proven, then you must try to understand whether it was due to a sampling error, or whether your hypothesis was wrong and what you got wrong**

**Either way, you must then decide whether to move forward or to re-formulate the hypothesis and repeat the test**

**What do we need practically for Stage 2?**

## SQUEAC Practical Needs

Stage	Pre-Existing Information	Staff Profile	Staff Number	Additional Resources	Estimated Number of Working Days
<b>1</b>	<p>Programme data (e.g. admissions and exits by month, seasonal calendar, full list of community volunteers and villages covered, programme reports, etc)</p> <p>Up to date list of all villages/ settlements by catchment area</p> <p>Accurate geographical map of size A1/A0 with scale close to 1:50,000</p>	<p>Local language speakers</p> <ul style="list-style-type: none"> <li>• Lead (e.g. Programme Coordinator, Programme Manager, M&amp;E/Surveillance Officer)</li> <li>• Programme staff (e.g. OTP support staff, Community Mobilisation Officers, etc.)</li> <li>• Partners (e.g. Nutrition Focal Point from district MoH)</li> </ul>	2-4	<p>Vehicle (ad hoc to collect information)</p> <p>Drivers with local knowledge</p>	7-10
<b>2</b>	None	<ul style="list-style-type: none"> <li>• Core team</li> <li>• (Additional Enumerators)</li> </ul>	4-8	Vehicle (full time)	2-3

**Question & Answer**  
**(5 minutes)**
